Nasa Student Challenge - 2007

To make space exploration more successful I think more technology could be made and/or spend more time researching. Nasa could also make sure every worker is very experienced. With newer technology and more experienced workers Nasa could extend their research and become more successful. In Nasa they need the highest technology and experienced workers.

The more people to research/make models the better. With more people you get a variety of ideas and opinions to get the best results of their project. Experienced, intelligent, and creative workers are needed for Nasa to be more successful. Too many people can cause problems, but not enough people cause a lack of progress.

If Nasa has and/or uses higher technology it should help increase data levels. Higher technology can also help us to learn more about the solar system. If higher technology and more

experienced workers don't help
to make Nasa more successful
I don't know what will.
These are my ideas for Nasa.
